

Merge Sort.

In: Unsorted Arraylist of ints.

Return: Sorted Array list of ints

Slice

$l_0 = 0$
 $h_1 = 4$

Slice

$l_0 = 4$
 $h_1 = 7$

Slice 1

Slice 2

Slice 3

Slice 4

Merge

7 < 1 no add 1
move pointer

7 < 5 no add 5
move pointer

pointer > length - 1 → add 7
move pointer

add 12

Merge

Merge

merge is done in Scratch 1928.

How are inputs/outputs for merge, slice determined and organized?

I need something that uses slice to generate all the atomic arrays.

Then I need something to feed them 2 at a time to merge.

if size > 1 then

size (0, size/2)

How will I make and organize n arrays?
